Orthorectification Service

Effortless Geometric Correction of Satellite Imagery

Analysis Ready Data

Intermap's orthorectification service is an accurate and reliable cloud-based orthorectification technology that transforms satellite imagery into analysis ready data. Based on highly accurate NEXTMap One™ elevation models with global coverage, our service geometrically corrects distortions in satellite imagery that are caused by topographical variations, sensor system parameters, and viewing perspective. Furthermore, customers will get accurate and consistent geolocation regardless of image source, allowing imagery from multiple vendors or collection times to be corrected and integrated.

Key Benefits & Features

Accurate

Uses Intermap's NEXTMap One™ elevation models to achieve accuracy better than 2 meters RMSE

Fast and Reliable

Runs on modern computing platforms to orthorectify in less than 30 minutes, regardless of image size and quantity

Cost Effective

Low-cost service without the need for specialized software, elevation data, and personnel

Secure

Runs on a secure computing platform, your data will be removed from the system once the process is complete

Simple

Upload imagery through web application or automatically through API and let us do the rest of the work

Scale

Our computing platform scales to meet your processing power needs, no matter how large your project is

Built on NEXTMap One™

Intermap's orthorectification is based on our unique and highly accurate NEXTMap One™ elevation model. This high-accuracy DEM is essential for producing exceptional results with the highest geometric accuracy.

Accuracy

Intermap's orthorectification service is accurate 2 meters RMSE or better. Since the rectified imagery is free from geometric errors, it enables you to focus on using the product in all levels of your mapping project including accurate feature collection.

For Everyone

Individuals, small businesses, and large enterprises will benefit from workflow integration using our API or web application.

Specifications

Supported Sensors	GeoEye IKONOS Pleiades Quickbird RADARSAT Sentinel-1 SPOT-5 SPOT-6 SPOT-7 TerraSAR-X WorldView-1 WorldView-2 WorldView-3 All sensors with RPCs	Supported Image Types	Radar RGB NIR Multispectral Panchromatic Pansharpened
		Accuracy	1 meter RMSE or better on NEXTMap One™ regional coverage and 2 meters RMSE or better for the rest of the world
		Integration	Web application API
		Correction	Topographical variation Viewing perspective Sensor system parameters

Accuracy is calculated against using LiDAR as base elevation model.
NEXTMap One™ Regional covers United States, Western Europe, and parts of Southeast Asia.
